

UZDT

Uzbekistan Digital Token

Whitepaper v1.0

Independent multi-chain digital asset project. Not government-issued. Not affiliated with Tether Limited or any other stablecoin issuer.

Public information edition - August 2026

1. Executive Summary

UZDT (Uzbekistan Digital Token) is an independent multi-chain digital asset project designed to provide a transparent, publicly verifiable token presence across several blockchain networks. The project focuses on blockchain accessibility, community participation, and interoperability across established ecosystems.

UZDT is not a state digital currency, is not issued by the Government of Uzbekistan or the Central Bank of the Republic of Uzbekistan, is not pegged to the Uzbek sum, and is not affiliated with Tether Limited or any other stablecoin issuer. UZDT should not be interpreted as a fiat-backed stablecoin or a guaranteed-value instrument.

2. Project Principles

- **Transparency:** official contract addresses are published and can be independently verified on public blockchain explorers.
- **Multi-chain accessibility:** UZDT is represented on multiple networks to reduce dependence on a single blockchain environment.
- **Clear identity:** the project uses the UZDT name and contract addresses as the primary identifiers of the asset.
- **Risk awareness:** cryptocurrency markets are volatile and users should independently verify contracts, liquidity, and market data before interacting.

3. Multi-Chain Architecture

UZDT currently maintains official token deployments on four networks. TRON is intentionally not included in this edition because the project has not yet designated a TRON deployment for this public release.

Network	Standard	Official address	Explorer
BNB Smart Chain	BEP-20	0x1dec961672eb9f837c33f65466556ec0bae515dc	https://bscscan.com/token/0x1dec961672eb9f837c33f65466556ec0bae515dc

4. Token Identification

Users should identify UZDT by network and contract address, not by ticker alone. Tickers can be duplicated by unrelated tokens. The contract addresses listed in this document and on the official website are the authoritative identifiers for this project.

The project may update website metadata, social links, or documentation over time, but a blockchain contract address remains the primary technical reference for a specific deployment.

5. Intended Utility

UZDT is intended as an ecosystem and community token. Potential uses can include community campaigns, ecosystem access, token-based rewards, and integrations with decentralized applications where technically and legally appropriate. Availability of a specific feature on one network does not imply that the same feature is available on all networks.

No feature described in this document should be understood as a promise of yield, profit, redemption, or guaranteed market value.

6. Market Price and Liquidity

UZDT does not guarantee a fixed exchange rate. Market prices displayed by exchanges, DEX trackers, wallets, or aggregators are derived from their own data sources and available liquidity. Thin or newly created liquidity pools can produce prices that are not representative of a broad market.

Users should verify liquidity depth, trading pairs, reserve ratios, and the exact token contract before relying on any displayed price. A third-party market-data provider can temporarily show stale, missing, or abnormal pricing without changing the user's on-chain token balance.

7. Security and Verification

- Verify the contract address before every transaction.
- Use official explorer pages to confirm balances, transfers, supply information, and contract code where available.
- Do not rely on token name, logo, ticker, or a social-media post as the sole proof of authenticity.
- Never share seed phrases or private keys with project representatives, support channels, or third parties.
- Treat links and addresses copied from unofficial chats or search results as untrusted until independently verified.

8. Governance and Administrative Controls

Administrative capabilities differ by deployment and are defined by the smart contract on each network. Users should review the verified source code and current contract ownership or authority settings on the relevant explorer before interacting. This whitepaper does not override on-chain contract logic.

9. Supply and Tokenomics Disclosure

Because UZDT is deployed across multiple networks, supply information should be verified per network using the relevant public explorer. This edition intentionally does not present a single combined circulating-supply figure unless it can be independently reconciled across all deployments and any migration or bridge mechanisms.

The project will publish material changes to official contracts, migrations, supply policies, or network support through its official website and communication channels.

10. Legal and Independence Notice

UZDT is an independent cryptocurrency project. It is not a government-issued currency, central bank digital currency, bank deposit, electronic money product, or representation of the Uzbek sum. The project is not affiliated with the Central Bank of the Republic of Uzbekistan, the Government of Uzbekistan, Tether Limited, or any other stablecoin issuer.

Nothing in this whitepaper constitutes investment, legal, tax, or financial advice. Digital assets involve technological, market, liquidity, regulatory, and counterparty risks. Users are responsible for evaluating those risks and complying with applicable laws in their jurisdiction.
